

Abstract

[0029] A method for creating a software installation package, a data storage medium storing the package, and a method for using the package are provided, wherein the package comprises an Operating System (OS) software program, an application program and possibly a configuration file of the application program. The package is created by
5 inserting the application program in a partition data of the OS software program, and by generating the software installation package comprising the OS software program and the application program. Optionally, the package contains a configuration file inserted preferably in a memory disk image of an OS partition data of the OS software program. For using the package, a computer is started on a data storage medium storing the package,
10 and the OS software program is installed on the computer from the data storage medium. Then, the application program is installed on the computer system, and optionally is configured with information from the configuration file.
